

HIWER™ PLUS

FOR FLOATING ROW COVERS AND NETS

MACHINE
WEIGHT
450 lbs

The machine's
maximum axle load
is 1,100 lb

SPECIFICATIONS

The HIWER system handles floating row covers and nets efficiently and facilitates collection, installation, transportation in and out of the field, and storage.

The special HIWER reel is included in the purchase of the machine. It opens to give the user access to the reel's central axle. Unlike standard reels, the HIWER reel allows you to install a cardboard tube on the central axle to roll up damaged materials for disposal. It is also fitted with a crank handle for decompressing the contents before opening.

In addition to a hydraulic motor, the HIWER system is now equipped with ball bearings on the winding mechanism to better guide the row covers and threads on the reel. A hectare, or two-and-a-half acres, of row covers or nets can be wound on a reel.

ADVANTAGES

This is a one-person system that requires no manual heavy lifting. The material doesn't twist, is cleaner and sustains less damage. As a result, it will last longer, since the machine handles it with greater care.

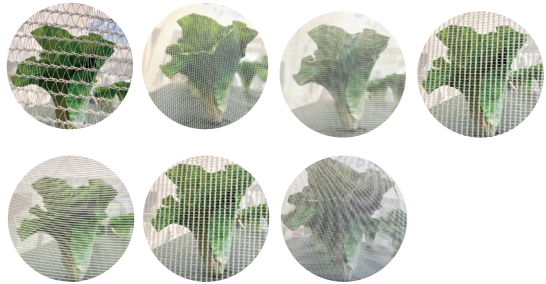

USES

The HIWER system is designed for use with these products:

Floating row covers (Agryl, Novagryl)

Exclusion insect netting

Bird netting (collection only)

Greenhouse films (collection only)

ACCESSORIES

Bag with handle for floating row cover

Ideal for holding down perforated tarpaulins, non-woven covers, Hibertex Pro, insect netting, silage covers, etc.

EasyKlip

Single grip: the harder you pull, the tighter the grip. Instead of loosening when the load is too heavy, the grip becomes stronger.
